1. When should a bar chart be preferred over a line graph?

→ A bar chart is preferred when comparing values across different categories or groups, especially when there is no continuous trend over time.

2. What type of data is represented using a histogram?

→ A histogram represents continuous numerical data, grouped into class intervals to show frequency.

3. In which situation is a pie chart more useful than a bar chart?

→ A pie chart is more useful when you want to show how a whole is divided into parts, such as percentage or proportion contributions.

4. What does a large sector in a pie chart signify?

→ A large sector indicates a larger proportion or higher percentage of the total data.

5. Which chart compares different categories easily?

→ A bar chart compares different categories most easily and clearly.
